- Let N be a group.
- Let G be a group.
- Let $\varphi : G \rightarrow \text{Aut}(N)$ be a group homomorphism.
- As a set, the **outer semidirect product** $N \rtimes_{\varphi} G$ of N and G with respect to φ is $N \times G$.
 - ◊ The group operation is defined by

$$(n_1, g_1) \cdot (n_2, g_2) = (n_1 \cdot \varphi(g_1)(n_2), g_1 g_2)$$

for all $n_1, n_2 \in N$ and all $g_1, g_2 \in G$.

The Skew group rings

- Let R be a ring with 1.
- Let G be a finite group.
- Let $\varphi : G \rightarrow \text{Aut}(R)$ be a group homomorphism.
- As a set, the **skew group ring** $R \rtimes_{\varphi} G$ of G over R induced by φ consists of all formal sums

$$\sum_{g \in G} a_g g \quad \text{where } a_g \in R \text{ for all } g \in G.$$

- ◇ The addition operation is component-wise.
- ◇ The multiplication is distributively defined by

$$a_1 g_1 \cdot a_2 g_2 = (a_1 \cdot \varphi(g_1)(a_2)) g_1 g_2$$

for all $a_1, a_2 \in R$ and all $g_1, g_2 \in G$.

The Skew group rings

- Every element $a \in R$ can be viewed as the element $a \cdot 1$ of $R \rtimes_{\varphi} G$.
- Every element $g \in G$ can be viewed as the element $1 \cdot g$ of $R \rtimes_{\varphi} G$.
- Suppose that R is a unital associative algebra over a field \mathbb{F} . Then $R \rtimes_{\varphi} G$ is a unital associative algebra over \mathbb{F} .
 - ◇ The scalar multiplication is defined by

$$c \left(\sum_{g \in G} a_g g \right) = \sum_{g \in G} (ca_g) g$$

where $c \in \mathbb{F}$ and $a_g \in R$ for all $g \in G$.

The algebra A is called a **Hopf algebra** if the following hold:

- There is a unital algebra homomorphism $\Delta : A \rightarrow A \otimes A$ such that

$$(1 \otimes \Delta) \circ \Delta = (\Delta \otimes 1) \circ \Delta.$$

The map Δ is called the comultiplication of A .

- There is a unital algebra homomorphism $\varepsilon : A \rightarrow \mathbb{F}$ such that

$$m \circ (1 \otimes (\iota \circ \varepsilon)) \circ \Delta = 1,$$

$$m \circ ((\iota \circ \varepsilon) \otimes 1) \circ \Delta = 1.$$

The map ε is called the counit of A .

- There is a linear map $S : A \rightarrow A$ such that

$$m \circ (1 \otimes S) \circ \Delta = \iota \circ \varepsilon,$$

$$m \circ (S \otimes 1) \circ \Delta = \iota \circ \varepsilon.$$

The map S is called the antipode of A .

Lie algebras, Hopf algebras and skew group rings

- Let \mathfrak{g} be a finite-dimensional Lie algebra over \mathbb{C} .
- Let $U(\mathfrak{g})$ be the universal enveloping algebra of \mathfrak{g} .
- Each element of \mathfrak{g} can be viewed as an element of $U(\mathfrak{g})$.
- The algebra $U(\mathfrak{g})$ is generated by all $u \in \mathfrak{g}$.
- $U(\mathfrak{g})$ is a Hopf algebra.

◇ The comultiplication of $U(\mathfrak{g})$ is a unital algebra homomorphism $\Delta_1 : U(\mathfrak{g}) \rightarrow U(\mathfrak{g}) \otimes U(\mathfrak{g})$ given by

$$\Delta_1(u) = u \otimes 1 + 1 \otimes u \quad \text{for all } u \in \mathfrak{g}.$$

◇ The counit of $U(\mathfrak{g})$ is a unital algebra homomorphism $\varepsilon_1 : U(\mathfrak{g}) \rightarrow \mathbb{C}$ given by

$$\varepsilon_1(u) = 0 \quad \text{for all } u \in \mathfrak{g}.$$

◇ The antipode of $U(\mathfrak{g})$ is a unital algebra anti-automorphism $S_1 : U(\mathfrak{g}) \rightarrow U(\mathfrak{g})$ given by

$$S_1(u) = -u \quad \text{for all } u \in \mathfrak{g}.$$

Lie algebras, Hopf algebras and skew group rings

- Let G be a group.
- Let $\mathbb{C}[G]$ be the group algebra of G over \mathbb{C} .
- $\mathbb{C}[G]$ is a Hopf algebra.
 - ◇ The comultiplication of $\mathbb{C}[G]$ is a unital algebra homomorphism $\Delta_2 : \mathbb{C}[G] \rightarrow \mathbb{C}[G] \otimes \mathbb{C}[G]$ given by

$$\Delta_2(g) = g \otimes g \quad \text{for all } g \in G.$$

- ◇ The counit of $\mathbb{C}[G]$ is a unital algebra homomorphism $\varepsilon_2 : \mathbb{C}[G] \rightarrow \mathbb{C}$ given by

$$\varepsilon_2(g) = 1 \quad \text{for all } g \in G.$$

- ◇ The antipode of $\mathbb{C}[G]$ is a unital algebra anti-automorphism $S_2 : \mathbb{C}[G] \rightarrow \mathbb{C}[G]$ given by

$$S_2(g) = g^{-1} \quad \text{for all } g \in G.$$

 $U(\mathfrak{sl}_2)_{\mathbb{Z}/2\mathbb{Z}}$ -
modules

The universal
Bannai-Ito
algebra, the

- Assume that G is a finite subgroup of $\text{Aut}(\mathfrak{g})$.
- By the universal property of $U(\mathfrak{g})$ every $g \in G$ can be lifted to an algebra automorphism of $U(\mathfrak{g})$. The group G can be viewed as a finite subgroup of $\text{Aut}(U(\mathfrak{g}))$.
- This induces a skew group ring $U(\mathfrak{g}) \rtimes G$ of G over $U(\mathfrak{g})$.
- We simply write $U(\mathfrak{g})_G = U(\mathfrak{g}) \rtimes G$.

Lie algebras, Hopf algebras and skew group rings

$U(\mathfrak{g})_G$ has the following Hopf algebra structure:

- The comultiplication of $U(\mathfrak{g})_G$ is a unital algebra homomorphism $\Delta : U(\mathfrak{g})_G \rightarrow U(\mathfrak{g})_G \otimes U(\mathfrak{g})_G$ defined by

$$\Delta(a) = \Delta_1(a) \quad \text{for all } a \in U(\mathfrak{g}),$$

$$\Delta(g) = \Delta_2(g) \quad \text{for all } g \in G.$$

- The counit of $U(\mathfrak{g})_G$ is a unital algebra homomorphism $\varepsilon : U(\mathfrak{g})_G \rightarrow \mathbb{C}$ defined by

$$\varepsilon(a) = \varepsilon_1(a) \quad \text{for all } a \in U(\mathfrak{g}),$$

$$\varepsilon(g) = \varepsilon_2(g) \quad \text{for all } g \in G.$$

- The antipode of $U(\mathfrak{g})_G$ is a unital algebra anti-automorphism $S : U(\mathfrak{g})_G \rightarrow U(\mathfrak{g})_G$ defined by

$$S(a) = S_1(a) \quad \text{for all } a \in U(\mathfrak{g}),$$

$$S(g) = S_2(g) \quad \text{for all } g \in G.$$

Lie algebras, Hopf algebras and skew group rings

- The Lie algebra \mathfrak{sl}_2 over \mathbb{C} consists of all 2×2 matrices with entries in \mathbb{C} with trace zero. The Lie bracket $[\cdot, \cdot]$ is defined by $[X, Y] = XY - YX$.
- The Lie algebra \mathfrak{sl}_2 has the basis

$$E = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}, \quad F = \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix}, \quad H = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}.$$

- There is a Lie algebra automorphism $\rho : \mathfrak{sl}_2 \rightarrow \mathfrak{sl}_2$ that sends

$$E \mapsto F, \quad F \mapsto E, \quad H \mapsto -H.$$

- Note that $\rho^2 = 1$.

Theorem 7.1

Suppose that V is a $U(\mathfrak{sl}_2)_{\mathbb{Z}/2\mathbb{Z}} \otimes U(\mathfrak{sl}_2)_{\mathbb{Z}/2\mathbb{Z}}$ -module. Then $V(1)$ is a \mathfrak{BI} -module given by

$$X = \Delta(E\rho),$$

$$Y = \frac{H \otimes 1 - 1 \otimes H}{2},$$

$$Z = (E \otimes 1 - 1 \otimes E)\Delta(\rho).$$

The universal Bannai–Ito algebra, the skew group ring $U(\mathfrak{sl}_2)_{\mathbb{Z}/2\mathbb{Z}}$ and Leonard triples

Definition 7.2

Let V denote a nonzero finite-dimensional vector space over a field \mathbb{F} . A **Leonard pair** on V consists of an ordered pair of linear transformations $A : V \rightarrow V$ and $A^* : V \rightarrow V$ that satisfy the following conditions:

1. There exists a basis for V with respect to which the matrix representing A is diagonal and the matrix representing A^* is irreducible tridiagonal.
2. There exists a basis for V with respect to which the matrix representing A^* is diagonal and the matrix representing A is irreducible tridiagonal.

Prof. Terwilliger introduced Leonard pairs and established the theory of Leonard pairs.

The universal Bannai–Ito algebra, the skew group ring $U(\mathfrak{sl}_2)_{\mathbb{Z}/2\mathbb{Z}}$ and Leonard triples

Definition 7.3

Let V denote a nonzero finite-dimensional vector space over a field \mathbb{F} . A **Leonard triple** on V consists of an ordered triple of linear transformations $A : V \rightarrow V$, $A^* : V \rightarrow V$, $A^\varepsilon : V \rightarrow V$ that satisfy the following conditions:

1. There exists a basis for V with respect to which the matrix representing A is diagonal and the matrices representing A^* and A^ε are irreducible tridiagonal.
2. There exists a basis for V with respect to which the matrix representing A^* is diagonal and the matrices representing A^ε and A are irreducible tridiagonal.
3. There exists a basis for V with respect to which the matrix representing A^ε is diagonal and the matrices representing A and A^* are irreducible tridiagonal.

algebra, the

Theorem 8.2

For any $x_0 \in \binom{\Omega}{d}$ the following statements hold:

1. There exists a unique algebra homomorphism $\mathfrak{BI} \rightarrow \mathbf{T}(x_0)$ given by

$$X \mapsto \mathbf{A},$$

$$Y \mapsto \frac{d+1}{2d+1} \mathbf{A}^*(x_0) + \frac{1}{2(2d+1)},$$

$$Z \mapsto \frac{d+1}{2d+1} \{\mathbf{A}, \mathbf{A}^*(x_0)\} + \frac{1}{2d+1} \mathbf{A}.$$

Moreover the algebra homomorphism is surjective.

2. X, Y, Z act on each irreducible $\mathbf{T}(x_0)$ -module as a Leonard triple.
